

### Abstract of the Disclosure

A remote sound monitor includes a receiver unit and a transmitter unit. The transmitter unit includes a sound transducer that receives the sound input and converts the sound input to the audio signal, and an audio transmitter that 5 transmits the audio signal. The receiver unit includes an audio receiver that receives a transmitted audio signal having a parameter that corresponds to an amplitude of a remote sound input, and a display that provides a visual indication of the parameter of the audio signal. The display providing the visual indication can flash, strobe, or change colors in response to a change in amplitude of the 10 sound input. The receiver unit can also include an audio speaker with a user-actuated amplification stage to provide remote audio output of the sound input.
